

GENERAL:

1).Where can I buy Nutrifresh Organic Eggs?

2).I can't find your organic eggs in my favorite store. What do I do?

Ans) Great question! We find that store managers are eager to carry products that their customers ask them for, so we suggest letting your store manager know that you would like to see our organic eggs at your store. You can also drop us a line at contact@nutrifreshheggs.com and we're happy to see what we can do to help.

3)What is the cost of Nutrifresh Eggs?

Ans) premium quality free range eggs pack of 6 costs ₹140

Classic package of 6 eggs costs ₹100

Basic package of 6 eggs costs ₹90

Pulp package of 30 eggs costs ₹450

4).Egg is a Non-Vegetarian?

Ans). Egg is a product of animal origin. The table eggs produced from free range farms are not fertile ones. It means, there is no developing embryo in these eggs. Milk is also a product of animal origin and if milk is considered as vegetarian, then why not egg?

5).Egg consumption and Heat production?

Ans).This assumption is not true. In fact an egg contributes only 84 Kcal of energy which is less than 4% of the recommended daily allowance of energy for human being.

Interestingly, the energy value of one egg is one fourth of the rice or wheat(340 Kcal/100g),which we routinely consume through our diet. Therefore, consumption of egg will not result in excess production of heat in the body. Rather it is beneficial to consume egg during summer which provides low calories but rich in other essential nutrients particularly anti stress vitamins, minerals whose requirement are higher during summer.

OUR FARMS:

1). May I visit one of your free range farms?

Ans) Yes, ofcourse! There is nothing hidden from you, everything that we do is transparent to our customers. We schedule farm visits to our customers and enthusiasts every time we got enough request. You can contact us on farms visits at contact@nutrifreshheggs.com .

2).What is the difference between caged, cage-free and free range farming?

Ans).Caged means the hens are kept in tightly packed wired cages their whole life and denied all their freedom. Unable even to spread their wings and turn around, caged hens are unable to display natural behavior. This is an unethical and inhuman way to raise hens. Cage-free or barn system means hens live in a confined area, between four walls. They are provided nest boxes to lay eggs. They have limited space for movement and can express only a few natural behavior. Often the pens are crowded with limited space, which leads to stress, pain and pecking each other.

Free Range means hens are allowed large open spaces to roam freely and to express all their natural behavior, a pen for night shelter and nests to lay eggs in privacy. Fresh air, sunshine and plenty of exercise keep them fit and healthy.
At Nutrifresh, we raise our hens the free-range way. They are happy birds and lay the best eggs.

3).How much space do you provide for each bird?

Ans) We provide lots of space as per RSPCA standards(100sq ft/bird) and rotating green pasture to forage, comfortable barns with perches & nest box to lay eggs in privacy.

During day they have fun basking in the sunshine, sand bath, rest on trees, socialize, fly & engage in just what they love to do. Humane, Ethical & Sustainable practices.

4).Do you provide shelter for birds at night?

Ans) We provide shelter for hens with standard space of around 2Sqft/bird with plenty of perches spread across the farms for freedom of expression and keep our hens feel safe.

5).How do you collect eggs in free range?

Ans) Hens in our farms doesn't lay eggs in open area because we provide nest boxes in special shelters to lay eggs in privacy. We collect eggs at regular intervals to calm down the hens from panic caused by other birds in line to lay eggs.

OUR EGGS :

1)Why Nutrifresh eggs cost more than other eggs in market?

Ans) Our free range hens produce less number of eggs per year when compared to commercial breeds.

In free range farm practices the birds engage in natural behaviours & burn a considerable energy in their day to day activity. Hence we feed them more compared to commercial breeds.

A lot of effort both in financial & labour, goes to maintain the green pastures for our hens in the range.Its evident on our strong, upright orange YOLK.

2)What causes double yolks?

Ans) Double yolks are fairly rare (about 1/1000) and double yolked eggs tend to be very, very large. They typically are graded as a 'Super Jumbo' because they are so large. These eggs primarily come from younger flocks that are just learning how to lay eggs

3) Why does egg shell colour vary and does egg quality vary with the colour of the shell?

Ans) Color changes in the eggshell are due to pigments called porphyrins being deposited while the eggs are in the process of formation. The process of color change is linked to the breed of a bird, which means color change is natural. Additionally, shell color has nothing to do with egg quality, flavor, nutritive value or cooking characteristics.

Nutrifresh eggs vary in shell color from tan to dark brown and, occasionally, white.

4) Why does the egg yolk colour vary between eggs? Does yolk colour indicate the nutritional quality of egg?

Ans) The carotenoids in the hen's feed make the yolks yellow. Carotenoids occur naturally in plants, fruits and vegetables. The greater the quantity of these colorful substances in the hen's diet, the stronger the shade of the yolk. While the yolk colour is not an indicator of nutritive value, a golden upright yolk signifies good quality eggs.

5) Why do blood spots occur in eggs?

Ans) Blood spots occur when blood or a bit of tissue is released along with yolk. Each developing yolk in a hen's ovary is enclosed in a sac containing blood vessels that supply yolk-building substances. When the yolk is mature, it is normally released from the only area of the yolk sac, called the stigma or suture line that is free of blood vessels. Occasionally, the yolk sac ruptures, causing blood vessels to break and blood to appear in the yolk or the white. Blood spots occur in less than one percent of all eggs laid. Blood spots may be triggered by too little vitamin A in a hen's diet, or they may be hereditary.

6) What is the difference between fertile & infertile eggs?

Ans) The difference is whether a rooster was involved or not in egg production. Hens do not need a rooster to lay eggs. Hens ovulate regularly. Such eggs are infertile. However, when a hen mates with a rooster, the eggs produced are fertile and under right incubation can bear chicks. There is no nutritional difference between fertile and infertile eggs. Nutrifresh eggs are infertile.

7) Why do some eggs float in water?

An egg that floats in water is actually a very old egg and should not be eaten, because it is not fresh! The reason that old eggs float is that the air cell that occurs naturally when the egg was laid has expanded, because the egg has aged. Check the best before date on the carton if you see this.

8) Do you wash the eggs? Does that impact their quality?

No, at Nutrifresh eggs we don't wash our eggs. It's counter-intuitive but true. Your eggs will stay fresher if you don't wash them at all. When hens lay eggs, there is a natural coating that is laid on top called the "bloom" that helps keep out bacteria. When you wash eggs, you drive some bacteria in through the pores of the shell, so it's a bad idea to do so as a general practice. Our nests are clean so are our eggs. If we found eggs with too much dirt or soiled we sanitize them without affecting the natural coating on egg.

9)How should i store eggs to keep them fresh?

Keep them refrigerated and only take them out about 30 minutes before you use them. Eggs can absorb flavors and odors so keep them in their cartons, pointed end down. Avoid washing them until they are ready to be used.

OUR HENS:

1)What do Nutrifresh Hens feed on?

Ans) Hens in our farm feed on grains, fresh greens, herbs and other 100% organic supplements formulated in-house, making for a balanced, healthy diet.

Our feed is natural; no animal by-product is fed to our birds. The feed is free from antibiotics, hormones and synthetic supplements.

In addition, our hens indulge in natural scavenging in the range and feed on highly nutritious greens, seeds and bugs. These feeding practices helps our hens lay nutritious & the best tasting eggs.

2) Why are herbs fed to hens and what herbs are these?

We include herbs in the diet of our hens. The herbs enrich the nutritive value of the eggs. We feed our hens herbs with a high medicinal value such as Brahmi, Basil, Sweet flag, Turmeric, Nilavembu, KeelaNelli, Neem and Aloevera.

3) Are birds de-beaked at Nutrifresh?

No, we do not practice de-beaking at Nutrifresh. Beaks are vital for the hens to engage in their natural instincts like foraging for food in the range, cleansing their feather and de-ticking.

4) What happens to sick or injured hens?

We rarely have this issue because our free range flocks are quite healthy and well cared for.

Nevertheless, our farmers keep an eye on their flocks all day long. Whenever we find a hen that is sick or injured, we segregate her, treat and then return her to the flock when she's back to full health.

In general, we have far less challenges with disease and injury than conventionally raised, caged hens because we don't overcrowd, the girls have access to the outdoors, fresh air and water, and can socialize with their hen cliques.

5)Do you give your hens hormones?

We do not. And the use of hormones is illegal for anyone raising poultry. Unfortunately, that is not the case with other types of farm animals.

6)Do you give your hens antibiotics?

No.

This practice was adopted by factory farms to deal with the constant filth and disease that is their chicken filled warehouses. They will typically treat healthy hens with antibiotics as a prophylactic measure.

Our barns are airy, uncrowded, clean and safe. If in the rare circumstance a hen is discovered to have a health issue requiring treatment, and this is very rare, she will be segregated from the main flock and treated with ayurvedic medicines. Her eggs will not go into our cartons until she is fully recovered and off any medications.
